Model introduction

Left and right type confirmation of AHU

Instruction

- In the direction of airflow, if the cooling and heating medium tube are on the right, the AHU is the right type. If the cooling and heating medium is on the left, the AHU is the left type.
- When the AHU does not connect the tube, in the airflow direction, if the inspection door is on the right, the AHU is right type. If the inspection door is on the left, the AHU is left type.
- For the standard model AHU in the brochure, the inspection door, the motor outlet hole and the cooling medium tube are on the same side. Please specify when ordering if customization is required.

04.

AHU Delivery Specification

- In this brochure, the units with air capacity which are lower than 50000m³/h (inclusive) are delivered as complete units or sections (This section refers to the structural section composed of several connected functional sections). Units above 50000m³/h will be delivered as parts. Please specify when ordering if customization is required.
- When the AHU is delivered as a complete unit or sections, the user should ensure that there is a passage in the site for moving the equipment.
- When the AHU is shipped as sections, the external length is calculated as:

$$\text{The sum of the length of each functional section} + (\text{sections numbers} - 1) * 70 = \text{AHU total}$$

AHU Features

Main design concept

1. The design is strictly in accordance with the national standard "GB / T14 294-2008 modular air conditioning unit" and the European standard "EN 1886-1998 Mechanical performance of air handling units for building ventilation", which not only focusing on the AHU aerodynamic and thermal performance but also paying attention to the mechanical performance of the unit structure.

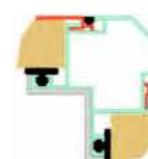

2. Adopt the "lengthened" optimized design concept to ensure that the steam in the humidification section is fully absorbed and the airflow in the flow equalization section and other sections is fully expanded, the airflow rate of the AHU cross-section is more uniform, the heat exchange is more sufficient, and the filtration is more efficient.

3. The AHU cabinet adopts a "screw-free" structure, high-quality "wear-resistant belt, stainless steel for wet-resistant parts" and other technology to prevent secondary pollution.

4. Adopting technologies such as "fluorine-free polyurethane", "three-dimensional vibration reduction", "low noise", "self-extinguishing", and "voltage-drop start" to ensure the unit's excellent environmental

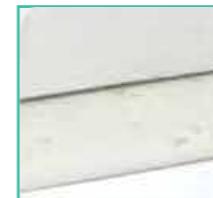

Cabinet structure features

Rivet-free structure

Adopting the patented technology of "Broken-bridge material for air-conditioning frame" (Patent No. ZL20032 0108849.8), without any connecting parts such as bolts and steel nails. It can not only ensure excellent sealing and thermal insulation performance but also avoid "leakage", "cold bridge", "rust" and other phenomena.

"Sandwich" panel structure

"Sandwich" panel structure, filled with 48-53kg/m³ fluorine-free polyurethane foam insulation material in combination with "constant temperature and constant flow" foaming technology, effectively avoid the occurrence of "over-foaming" and "under-foaming" and ensure the panel has a lower heat transfer coefficient and higher structural strength. Tested by authoritative institutions, the thermal insulation performance index is much higher than the national standard.

High-quality organic components

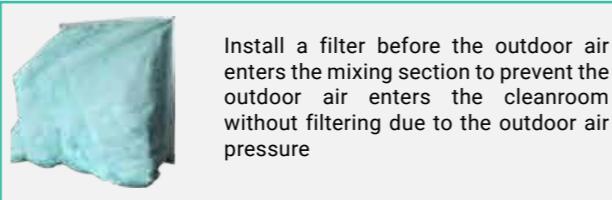

The organic components of the cabinet adopt world famous brands and are resistant to UV (ultraviolet), VHP (hydrogen peroxide), and ozone corrosion.

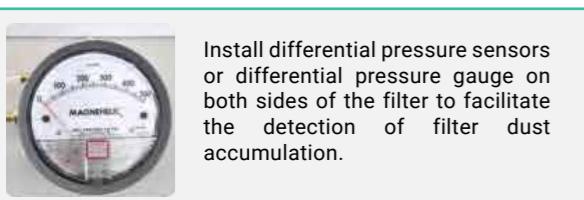

Filter section features

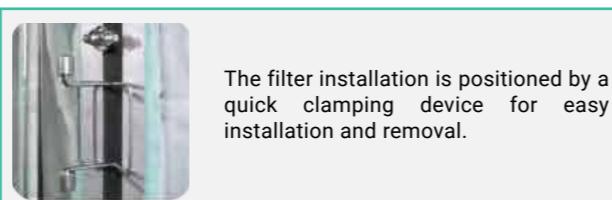

Adopt a world famous brand filter, high filtration efficiency.

Install a filter before the outdoor air enters the mixing section to prevent the outdoor air entering the cleanroom without filtering due to the outdoor air pressure.

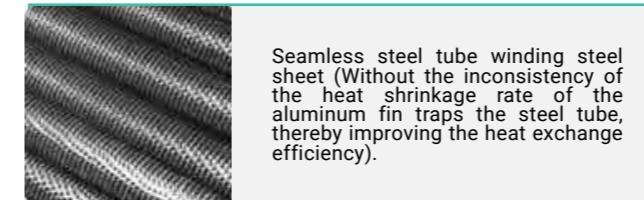

Install differential pressure sensors or differential pressure gauge on both sides of the filter to facilitate the detection of filter dust accumulation.

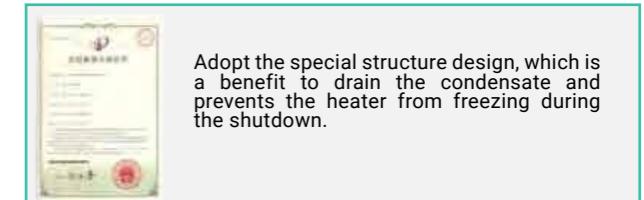

The filter installation is positioned by a quick clamping device for easy installation and removal.

Heating section features

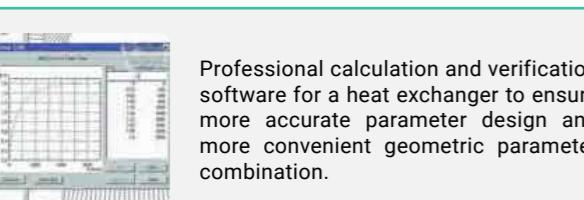

Seamless steel tube winding steel sheet (Without the inconsistency of the heat shrinkage rate of the aluminum fin traps the steel tube, thereby improving the heat exchange efficiency).

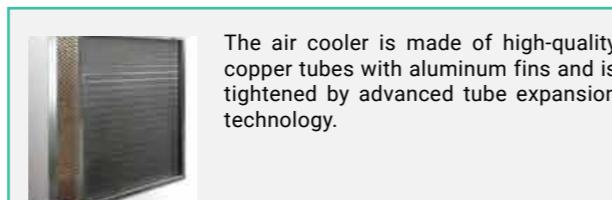

Adopt the special structure design, which is a benefit to drain the condensate and prevents the heater from freezing during the shutdown.

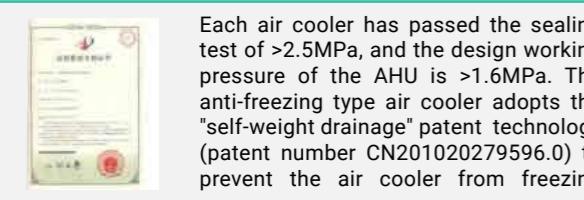

Air cooler section features

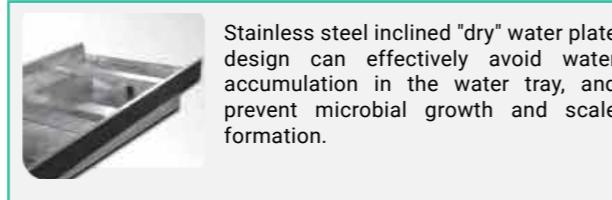

Professional calculation and verification software for a heat exchanger to ensure more accurate parameter design and more convenient geometric parameter combination.

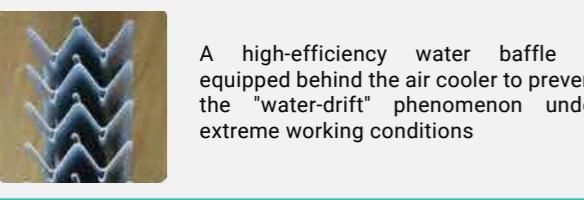

The air cooler is made of high-quality copper tubes with aluminum fins and is tightened by advanced tube expansion technology.

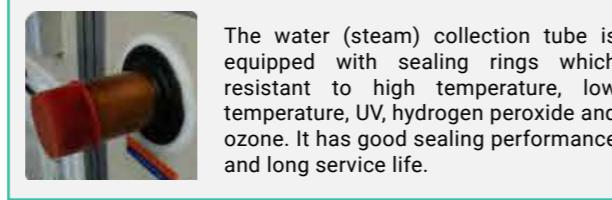

Each air cooler has passed the sealing test of $>2.5\text{MPa}$, and the design working pressure of the AHU is $>1.6\text{MPa}$. The anti-freezing type air cooler adopts the "self-weight drainage" patent technology (patent number CN201020279596.0) to prevent the air cooler from freezing.

Stainless steel inclined "dry" water plate design can effectively avoid water accumulation in the water tray, and prevent microbial growth and scale formation.

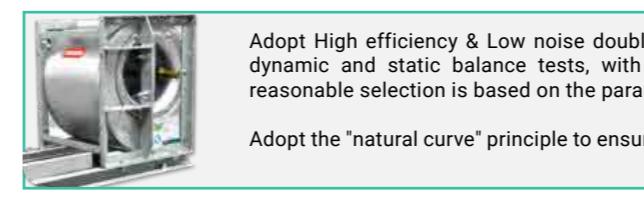

A high-efficiency water baffle is equipped behind the air cooler to prevent the "water-drift" phenomenon under extreme working conditions.

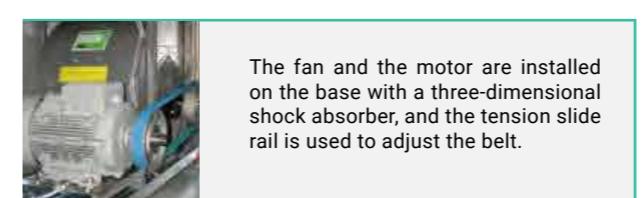

The water (steam) collection tube is equipped with sealing rings which are resistant to high temperature, low temperature, UV, hydrogen peroxide and ozone. It has good sealing performance and long service life.

Fan section features

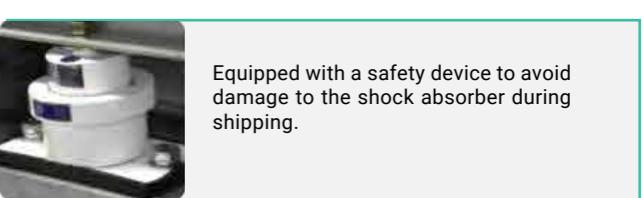

Adopt High efficiency & Low noise double inlet centrifugal fan. The fans have passed the rigorous dynamic and static balance tests, with the types of forward, backward and wing type. The reasonable selection is based on the parameters of air capacity, air pressure, noise, power, etc.

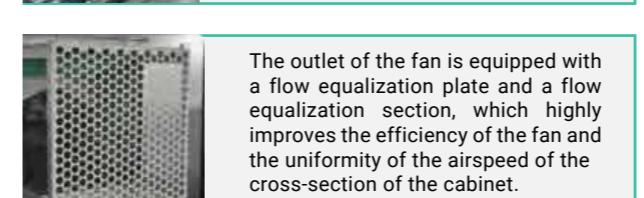

Adopt the "natural curve" principle to ensure that the centrifugal fan is always in an efficient operation.

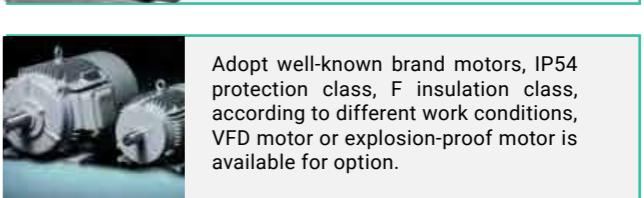

The fan and the motor are installed on the base with a three-dimensional shock absorber, and the tension slide rail is used to adjust the belt.

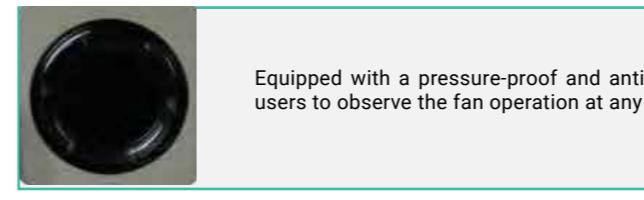

Equipped with a safety device to avoid damage to the shock absorber during shipping.

The outlet of the fan is equipped with a flow equalization plate and a flow equalization section, which highly improves the efficiency of the fan and the uniformity of the airspeed of the cross-section of the cabinet.

Adopt well-known brand motors, IP54 protection class, F insulation class, according to different work conditions, VFD motor or explosion-proof motor is available for option.

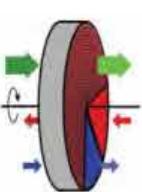

Equipped with a pressure-proof and anti-cold bridge sealing observation window, it is convenient for users to observe the fan operation at any time.

Humidifier section features

- According to different work conditions, the dry steam type, electrode type, electric heating type, high pressure spray type, high pressure micro-mist type and wet film type (not recommended for clean places) humidifiers are optional for the AHU.
- When the air temperature is lower than 15 or the humidification capacity is higher than 240kg/h, the quick absorption humidifier should be equipped.
- When a medium-efficiency filter in the downstream of the humidifier, an intermediate section should be equipped between the humidification section and the medium-efficiency filter section to improve the steam absorption efficiency.
- Adopt the "lengthened" to optimize the design concept, and the design of the lengthened

Heat recovery section features

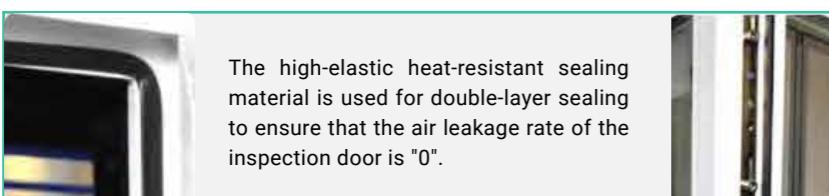

The AHU can be equipped with an energy recovery device to recover the heat in the exhaust system, and different types of heat recovery devices are optional as per the requirement:

- (1) Plate heat recovery heat exchanger
- (2) Runner heat recovery heat exchanger
- (3) Heat tube heat recovery heat exchanger
- (4) Liquid connected heat recovery heat exchanger

Inspection door features

The positive pressure section of the unit adopts an internally opened inspection door, and the negative pressure section uses an externally opened inspection door, which effectively reduces air leakage and extends the service life of the inspection door.

The high-elastic heat-resistant sealing material is used for double-layer sealing to ensure that the air leakage rate of the inspection door is "0".

The multi-point distributed locking mechanism can effectively improve the sealing performance of the unit, and can effectively prevent the

Control System

Users can choose different control systems according to their needs.

Optional control systems include the ordinary start-stop control cabinet, Automatic control system, PLC control system and centralized control system.

Start-stop control cabinet

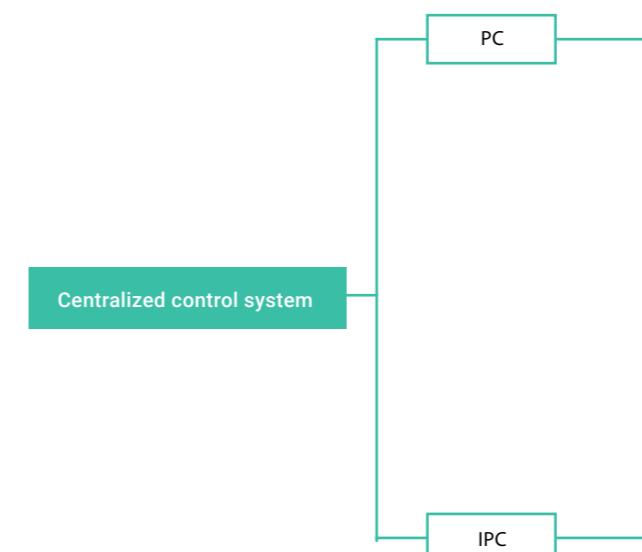

The ordinary control cabinet can realize manual control of starting and stopping of motor, electric heater and other equipment. The control cabinet includes circuit breaker, electromagnetic contactor, overload protector, time relay, indicator light, etc.

Automatic Control System

It is suitable for general comfort air-conditioning system. It is a control system composed of a DDC controller or single-chip micro computer, sensors, actuators, transmitters, electric valves, and various electrical components. It can realize automatic control of ordinary accuracy of temperature and humidity. At the same time, it has a complete system protection function to ensure the safe operation of the AHU.

PLC control system

Adopt industrial PLC programmable controller, and integrated software, power distribution device, sensors, actuators, transmitters, etc. to form a complete intelligent control system, which can independently and flexibly complete automatic collection, processing, and transmission of unit parameters. With the features of high-precision automatic control of temperature, humidity, pressure, flow, energy-saving operation and others. It is suitable for places with high requirements for temperature and humidity control accuracy or places where the air treatment process needs to be highly automated, especially for the cleanroom workshop, which can ensure that the AHU operates automatically and safely according to the predetermined requirements, realize unmanned management, and reduce management costs.

It has a variety of models for options. Different models can manage different numbers of devices, up to 120 devices, the length of wired wiring is up to 10km, also the wireless communication is available to achieve the communication between PC and PLC.

There are 3 screen sizes for option from 7", 10", 12", which can manage up to 8 devices, the wiring length is up to 2km. Adopting true color touch IPC, WINCE operating system, which can connect USB devices (mouse, keyboard, printer, U disk, etc.)

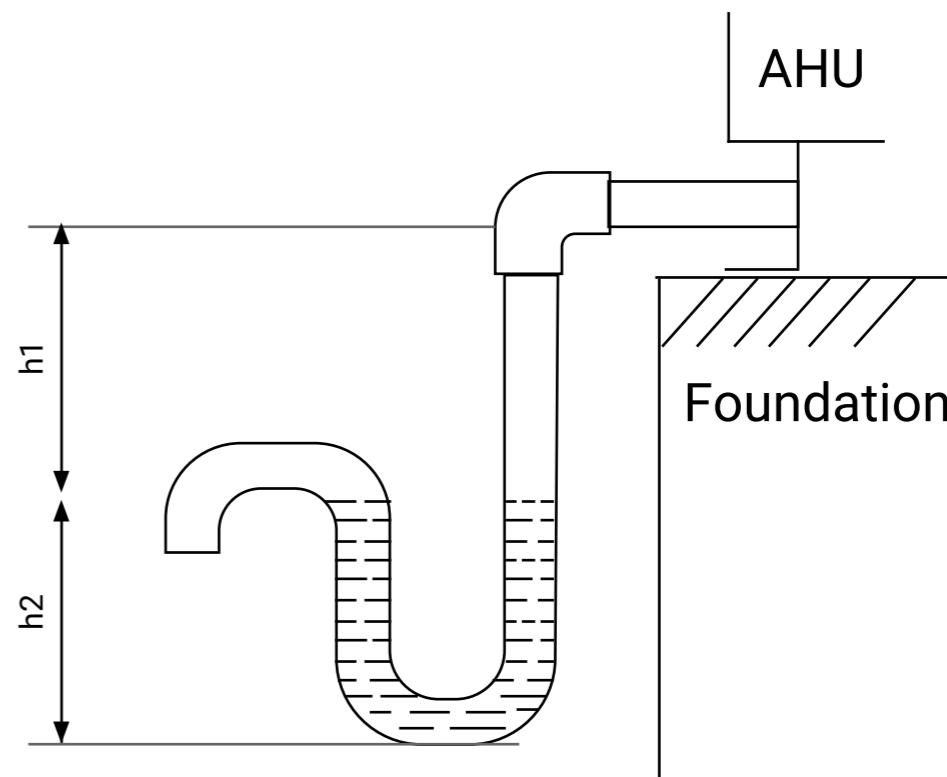

AHU installation, use and maintenance

AHU installation

- The AHU is usually shipped as sections or parts, during shipping and lifting, the parts such as the cabinet panel can't be damaged, so as not to affect the unit performance and installation accuracy.
- The AHU should be placed on a flat concrete foundation (or channel steel welded foundation) higher than 200-250mm above the ground of the machine room. The length and width of the concrete foundation are 200mm bigger than the outer contour of the unit, also the drainage ditches and floor drain are required. The length and width of the channel steel foundation should be the same as the length and width of the unit base. The channel steel is prepared by the user.
- When selecting the unit installation location, reserving more than 1m of maintenance space and future installation.
- During the on-site assembly, the functional sections are sealed with rubber and plastic sealing strips, and are clamped from the locking screws on the inside and bottom base of the unit with a special clamping device to prevent air leakage, and the joint will be coated with a sealant if necessary.
- After assembling each component, the internal debris must be removed. The water pipe of the external pipeline must be cleaned before connecting with the water inlet and outlet pipes of the AC unit to avoid blocking the water circuit.
- The inlet and outlet pipes must be equipped with valves and movable joints outside the unit, but the weight of the externally connected valves, pipes and equipment should not be borne by the unit.
- The motor should be connected to the power supply with a protective device, the casing of the unit should be grounded, and the motor bigger than 15KW should adopt the voltage-drop start method.
- The condensate drain pipe of the air cooler should be equipped with a water seal, and ensure smooth drainage (see the picture), the water seal is prepared by the user.
- The heat exchanger which using chilled and hot water as the medium, the lower part is the inlet pipe, and the upper part is the outlet pipe. The heater is using steam as the medium, the upper part is the steam inlet pipe, the lower part is the condensate water outlet pipe. The design working pressure of the air cooler is 1.6MPa, and the steam heater is 1.0MPa.

AHU use and maintenance

- The power supply of the AHU motor is three-phase 380V/3PH/50HZ. Before starting, please check whether the fan rotates flexibly, whether the fan impeller and the chassis collide. All mechanical and electrical equipment should be checked by professionals before starting. Please check whether the direction of rotation of the fan impeller is correct before running.
- When the AHU has multiple functions, the incorporates chain interaction requirements of each functional section should be considered. For example, the electric heating section should be turned on after the fan is started, and the electric heater must be turned off before the fan was turned off.
- The fan should be adjusted before running. If the air conditioner is not on loading, the air outlet should be blocked by 3/4, and the current of the motor should be controlled to run at the rated current to prevent the motor from being burned out. The air valve of the air outlet and inlet should be opened to prevent the pressure inside the machine from being too high, and deformed the unit. If necessary, install the air valve and motor opening and closing incorporate chain device.
- In order to avoid blockage of the water channel of the heat exchanger, a water filter should be installed on the water inlet pipe of the heat exchanger and the strainer should be cleaned regularly. The cleaned and softened water should be used for the chilled and hot medium water and the spray water.
- The dust accumulation of the filter should be checked frequently. When the resistance reaches the specified value, the filter should be cleaned or replaced. When cleaning, take out the filter, and blowback with compressed air, and clean it with a cleaning agent, and then use it again after drying. Special care should be taken not to damage the filter during cleaning or replacement, and check that the seal between the filter and the frame is tight. A non-woven filter is not recommended to be cleaned and used again.
- The tightness and wear of the belt should be checked regularly. If the belt is too loose or slips during operation, the adjustment bolt at the bottom of the motor can be adjusted. Severely worn belts should be replaced in time. The bearings of fans and motors should be regularly inspected and refueled to improve operating efficiency and life.
- The air conditioner should be fully cleaned after 2-3 years of operation. The pipes can be descaled by chemical methods, and the heat exchanger fins should be cleaned by compressed air or water.
- If you need to shut down in winter when it working, you must keep the hot water in the heat exchanger continuous. If the heat exchanger is not used in winter, to prevent it from frost racking, please drain the water and do the insulation work for the pipe, also close the outdoor air valve.
- AHU should be controlled by professionals, establish strict job responsibility systems and operating procedures, establish regulations and files for equipment operation and maintenance, and strengthen daily maintenance and maintenance.

$$h_1 = \frac{P}{11} + 50$$

$$h_1 \geq \frac{1}{2} h_1$$
